DETAILED ACTION

Drawings

1. The drawings were received on December 1, 2003. These drawings are acceptable.

Allowable Subject Matter

2. Claims 1-20 are allowed.

Hartford et al. teaches the construction of a microprocessor-based electronic control system for controlling the various functions of an internal combustion engine comprising:

a stator, and a rotor mounted in the stator;

a regulator circuit connected to the alternator and defining a variable reference voltage; and

a conversion circuit connected with the said regulator circuit, wherein the conversion circuit comprises, in combination:

an internal clock with a controllable variable period, being a voltage controlled oscillator;

a difference circuit connected to the internal clock for producing a difference signal between the period of the said reference control signal and the period of a signal from the internal clock;

a control circuit for the internal clock, connected to the internal clock and the difference circuit, for controlling the clock in response to the said difference signal whereby to equalize the period of the said clock signal with the period of the said control signal, and a bi-directional counter connected to the difference circuit for receiving the said difference pulses and direction signal; and

a voltage pulse width conversion circuit connected to the said clock and comprising a counter adapted to be paced by the said internal clock and to perform a count while the reference control signal is at a given logic level, and a digital/analogue converter connected to the counter for converting a value of count supplied to the converter by the counter into a voltage such as to define the reference voltage of the regulator, and having a memory station input, the alternator further including means for applying to the said input a memory station signal so long as the said reference control signal is at a logic level other than the said given logic level.

3. The following is an examiner's statement of reasons for allowance.

The prior art of record, taken alone or in combination, fails to teach the construction of a motor vehicle alternator as described on independent claims 1 and 11, comprising a stator and a rotor mounted in the stator, a conversion circuit, and a regulator circuit connected in the alternator provided to vary the excitation of the alternator by comparing a signal representing the output voltage of the alternator with a reference voltage.

Dependent claims 2-10 and 12-20 are considered allowable by their respective dependence on allowed independent claims 1 and 11.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

4. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. See PTO-892.
